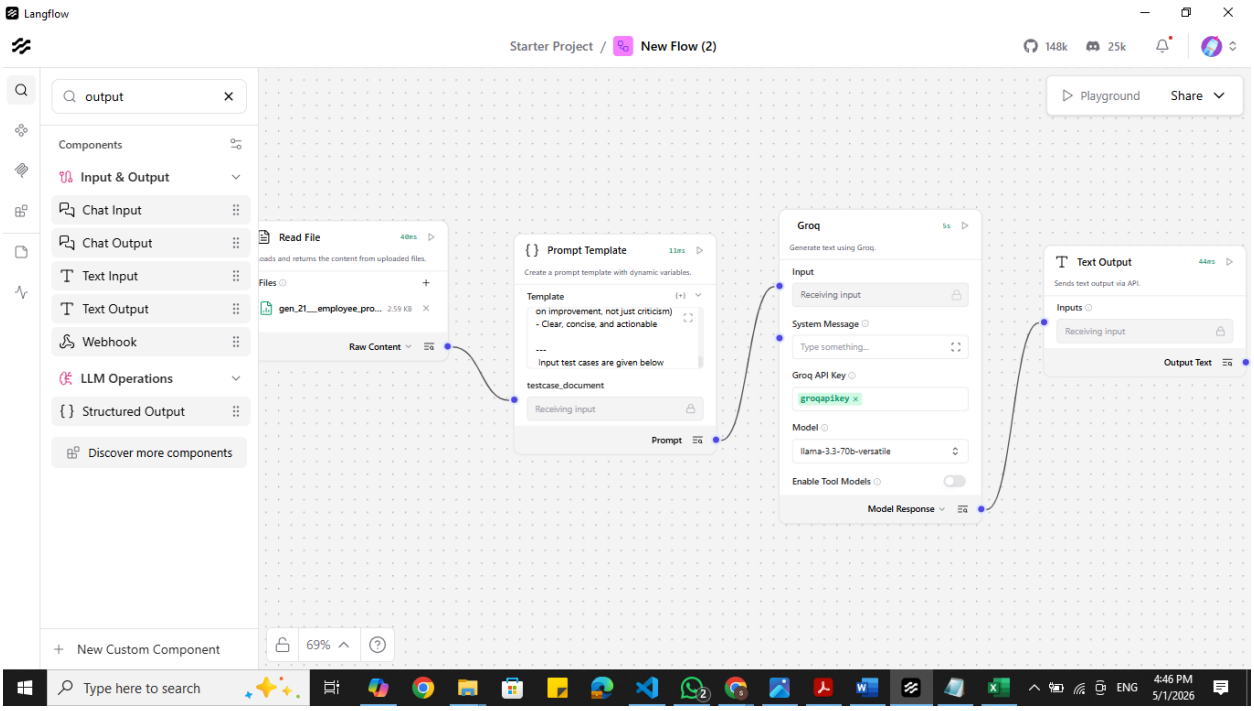
# Langflow:



# Prompt + Input:

Instructions

You are tasked with reviewing a given **test case** for quality. Assess it across three dimensions:

- **Completeness**: Does it cover all necessary inputs, steps, and expected outcomes?

- **Clarity**: Is it easy to understand, unambiguous, and logically structured?

- **Best Practices**: Does it follow industry standards for test case writing (e.g., proper naming, consistent formatting, clear preconditions, reusable steps)?

After reviewing, produce:

1. A **list of issues** found in the test case.

2. **Suggestions for improvement** to address those issues.

3. An **improved version of the test case** that incorporates your recommendations.

---

Context

The test case is part of a software QA process. High-quality test cases ensure reliable validation of features, reduce ambiguity, and improve collaboration between QA engineers, developers, and stakeholders. Your role is to act as a reviewer who enhances the test case for better execution and maintainability.

---

Examples

**Input Test Case (sample):**

```
Title: Login Test

Steps:

1. Open app

2. Enter username

3. Enter password

4. Click login

Expected Result: User logs in
```

**Output Review (sample):**

- Issues:
  - Title too vague.
  - Missing preconditions (e.g., valid account exists).
  - Expected result lacks detail (e.g., dashboard should load).
- Suggestions:
  - Use descriptive title: "Valid User Login".
  - Add preconditions: "User account with valid credentials exists".
  - Expand expected result: "User is redirected to dashboard with personalized content".

- Improved Test Case:

```

Title: Valid User Login

Preconditions: User account with valid credentials exists

Steps:

1. Launch application

2. Navigate to login page

3. Enter valid username

4. Enter valid password

5. Click 'Login' button

Expected Result: User is redirected to dashboard with personalized content displayed

```

---

Persona

You are a **QA Lead** with expertise in test design, clarity, and industry best practices. You provide constructive feedback, balancing critique with actionable improvements. You aim to elevate the test case to professional standards.

---

Output Format

Your response must include:

1. **List of Issues** (bullet points)

2. **Suggestions for Improvement** (bullet points)

3. **Improved Test Case** (formatted clearly with sections: Title, Preconditions, Steps, Expected Result)

---

Tone

- Professional yet approachable

- Constructive and supportive (focus on improvement, not just criticism)

- Clear, concise, and actionable

---

Input test cases are given below

{testcase_document}

# Output:

### List of Issues

* Test case titles are not descriptive enough and do not follow a standard naming convention.

* Categories (Positive, Negative, Edge) are not clearly defined in the context of the test cases.

* Expected results lack detail and do not specify what exactly is expected to be displayed or happen.

* Steps are not consistently formatted and lack specificity (e.g., "Navigate to the employee profile section" could be more detailed).

* Test data is often listed as "N/A" without explanation, which could imply a lack of consideration for input data.

* Preconditions are not explicitly stated, which could lead to confusion about the starting state for each test case.

* There is no clear differentiation between test cases that seem to cover similar scenarios (e.g., TC-001 and TC-008).

* Error messages and system responses are not specified, making it difficult to determine the exact expected outcome.

* Test cases do not account for various user roles and their respective permissions.

### Suggestions for Improvement

* Use a standardized naming convention for test case titles that includes the feature and the specific scenario being tested.

* Clearly define the categories (Positive, Negative, Edge) and ensure each test case fits into one of these categories based on its expected outcome.

* Expand expected results to include specific details about what should be displayed or happen, including any error messages.

* Standardize the formatting of steps to improve readability and ensure each step is concise and actionable.

* Specify test data requirements for each test case, even if it's to confirm that "N/A" is appropriate due to the nature of the test.

* Explicitly state preconditions for each test case to ensure clarity on the starting conditions.

* Review test cases for redundancy and ensure each case covers a unique scenario or set of conditions.

* Include expected error messages or system responses in the expected results to provide clear pass/fail criteria.

* Consider adding test cases that cover different user roles and their respective permissions to ensure the system behaves as expected across various access levels.

### Improved Test Case

Given the nature of the input, I will select one test case to improve as an example. Let's take **TC-001: "View Employee Profile Basic Details"**.

#### Title

View Employee Profile Basic Details - Valid Employee ID

#### Preconditions

- The user has the necessary permissions to view employee profiles.

- An employee with a valid ID and complete basic details exists in the system.

#### Steps

1. Log in to the system with a user account that has permission to view employee profiles.

2. Navigate to the employee profile section.

3. Search for an employee by their valid ID.

4. Select the employee from the search results to view their profile.

5. Verify that the employee's basic details are displayed.

#### Expected Result

The system displays the employee's basic details accurately, including name, job title, department, and contact information, without any error messages.

#### Test Data

- Valid employee ID: [Insert a specific valid ID or a format for generating one].

- User credentials for an account with view permissions.

This improved version includes a more descriptive title, clear preconditions, detailed steps, and a specific expected result. It also suggests what test data might be needed, making the test case more comprehensive and easier to execute.
